PROJECT SUMMARY

Dora is a tool for DevOps insights display and analysis, with integrated data sources in the backend engine from Apache DevLake and with Apache Superset as its powerful business intelligence provider.

Dora ingests, analyzes, and visualizes the fragmented data from DevOps tools to distill insights for engineering excellence -- Dev Data lives in silos, and Dora brings them all together to give you a complete view of your Software Development Life Cycle (SDLC). From custom metrics to scrum retros, DevLake implements metrics effortlessly with prebuilt dashboards supporting common frameworks and goals. Instead of Grafana, which is DevLake's default choice of dashboard implementation, Superset is chosen to provide rich visualization capabilities, SQL-based Ad-Hoc Analysis, Data Exploration and Drill-Down, Data Governance and Security and Python Integration and Extensibility.
